

TO-220 Plastic-Encapsulate Voltage Regulators

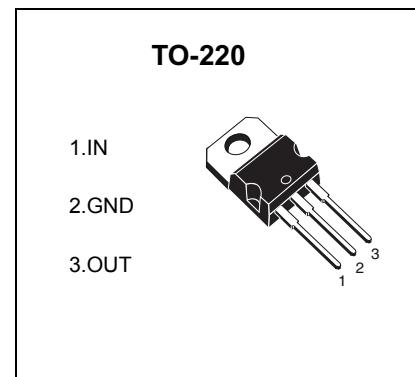

LM317 Three-terminal positive voltage regulator

DESCRIPTION

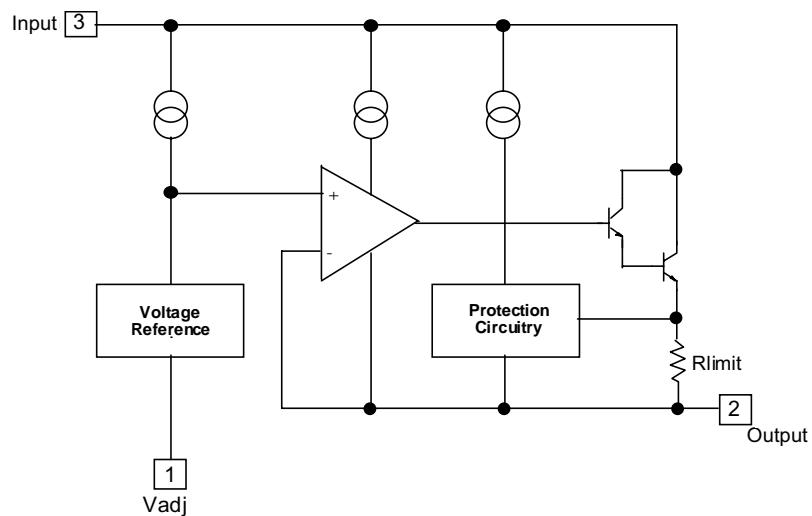

This monolithic integrated circuit is an adjustable 3-terminal positive voltage regulator designed to supply more than 1.5A of load current with an output voltage adjustable over a 1.2 to 37V. It employs internal current limiting, thermal shut-down and safe area compensation.

FEATURE

- Internal thermal overload protection
- Internal short circuit current limiting
- Output transistor safe operating area compensation

Notes:

- Load and line regulation are specified at constant junction temperature. Change in V_D due to heating effects must be taken into account separately. Pulse testing with low duty is used. ($P_{MAX} = 20W$)
- C_{ADJ} , when used, is connected between the adjustment pin and ground.

Typical Application

$$V_o = 1.25V \left(1 + \frac{R_2}{R_1}\right) + I_{adj} R_2$$

C_i is required when regulator is located an appreciable distance from power supply filter.

C_o is not needed for stability, however, it does improve transient response.

Since I_{adj} is controlled to less than 100 μA, the error associated with this term is negligible in most applications.
